Planck 2018 Results: Cosmological Parameter Tables

July 9, 2018

Abstract

These tables summarize the results of *Planck* 2018 parameter estimation exploration results. They are based on *Planck* HFI data and *Planck* lensing, as well as additional non-CMB data as detailed in the main parameter papers.

1 Introduction

The tables are arranged in groups, firstly by cosmological model, and then by data combination. The name tags match those of the full chains also provided on the PLA. The names all start with `base` to denote the baseline model, followed by the parameter tags of any additional parameters that are also varied (as defined in the parameter paper). Data combination tags are as follows (see the parameters paper for full description and references):

Data tag	Data used
`plikHM`	Baseline high-ℓ *Planck* power spectra (`plik` cross-half-mission, $30 \leq \ell \leq 2508$).
`CamSpecHM`	`CamSpec` high-ℓ *Planck* power spectra.
`CleanedCamSpecHM`	Foreground-cleaned `CamSpec` high-ℓ *Planck* power spectra.
`lowl`	Low-ℓ *Planck* temperature (`Commander`, $2 \leq \ell \leq 29$).
`lowE`	Low-ℓ HFI EE polarization only (`SimAll`, $2 \leq \ell \leq 29$).
`lensing`	*Planck* lensing power spectrum reconstruction. When used without other CMB likelihoods, it is marginalized over the theory CMB spectra given.
`BAO`	Baryon oscillation data from BOSS DR12, MGS, and 6DF.
`Pantheon`	Supernova data from the Pantheon sample.
`JLA`	Supernova data from the SDSS-II/SNLS3 Joint Light-curve Analysis.
`Riess18`	Hubble parameter measurement from SHOES (Riess et al. 2018a, $H_0 = 73.45 \pm 1.66$).
`zre6p5`	A hard prior, $z_{\rm re} > 6.5$.
`reion`	A hard prior, $z_{\rm re} > 6.5$, combined with a Gaussian prior, $z_{\rm re} = 7 \pm 1$.
`lenspriors`	Standard base parameters with $n_{\rm s} = 0.96 \pm 0.02$, $\Omega_{\rm b}h^2 = 0.0222 \pm 0.0005$, $100 > H_0 > 40$, $\tau = 0.055$.
`DESpriors`	DES cosmological parameter priors (flat on $0.1 < \Omega_{\rm m} < 0.9$, $0.03 < \Omega_{\rm b} < 0.07$, $55 < H_0 < 91$, $0.5 < 10^9 A_{\rm s} < 5$, $Y_{\rm P} = 0.245341$ and, if varied, $0.05{\rm eV} < \sum m_\nu < 1{\rm eV}$).
`CookeDH`	A Gaussian prior $\Omega_{\rm b}h^2 = 0.0222 \pm 0.0005$ (conservative, motivated by Cooke et al. 2017).
`Cooke17`	A Gaussian prior on D/H (Cooke et al. 2017), mean and error adjusted to approximately agree with `CookeDH` for $N_{\rm eff} = 3.046$.
`Aver15`	A Gaussian constraint on $Y_{\rm P}^{\rm BBN} = 0.2449 \pm 0.0040$ (Aver et al. 2015).
`theta`	A Gaussian prior $100\theta_{\rm MC} = 1.0409 \pm 0.0006$ (acoustic scale from *Planck* CMB without LCDM assumption).
`WMAP`	The full WMAP (temperature and polarization) 9-year data.
`DES`	DES 1yr, cosmic shear+galaxy auto+cross.
`DESlens`	DES 1yr, cosmic shear only.
`DESwt`	DES 1yr, galaxy auto+cross only.

The high-ℓ *Planck* likelihoods have `TT`, `TE`, `EE` variants from each spectrum alone, plus the `TTTEEE` joint constraint. Note that unless `mnu` is specified in the file name, the neutrino mass sum is fixed to $\sum_\nu m_\nu = 0.06{\rm eV}$ (including for DES chains). Non-linear corrections are modelled with HMCode in all cases (including when using DESpriors).

Data likelihoods are either included when running the chains, or by importance sampling. Data combinations that are added by importance sampling appear at the end of the list, following the `post_` tag. Note that the best fits are merely examples of parameter combinations that fit the data well; due to parameter degeneracies there may be other combinations of parameters that fit the data nearly equally well.

Beneath each table is the $\chi^2_{\rm eff} = -2\log({\rm likelihood})$ for each best-fit model, and also the contributions coming from each separate part of the likelihood. Mean minus log likelihoods are also given, as $\bar{\chi}^2_{\rm eff}$. The tables also give the $\chi^2_{\rm eff}$ of the various component parts of the likelihood, where quoted values are the best-fit and mean, standard deviation (in the case of $1\,\sigma$ tables), or effective degrees of freedom (ν, defined by $\sigma^2/2$). Normalization of likelihoods is arbitrary, i.e., a constant can be added to log likelihoods without affecting any results. Only some likelihoods normalize so that the number is immediately interpretable as similar to a χ^2 for some number of data points.

The $R-1$ value is also given, which measures the convergence of the sampling chains, with small values being better converged. The sampling uncertainty on quoted mean values are typically of order $R-1$ in units of the standard deviation.

Parameter constraints were calculated from Monte Carlo chains from `CosmoMC` using `GetDist` (getdist.readthedocs.org).

Parameters and derived parameters, along with the name tags used in the chain files, are briefly described in the tables below.

Additional nuisance parameters for each likelihood are described in more detail in the respective papers.
